

From Dev to Production

Hey, when do we get
to work on the site?

From Dev to Production

I started the v17 rollout...
how's it look?

So far, so good...

From Dev to Production

I started the v17 rollout...
how's it look?

Yay!
That's four
major releases
this month
with zero
rollbacks!

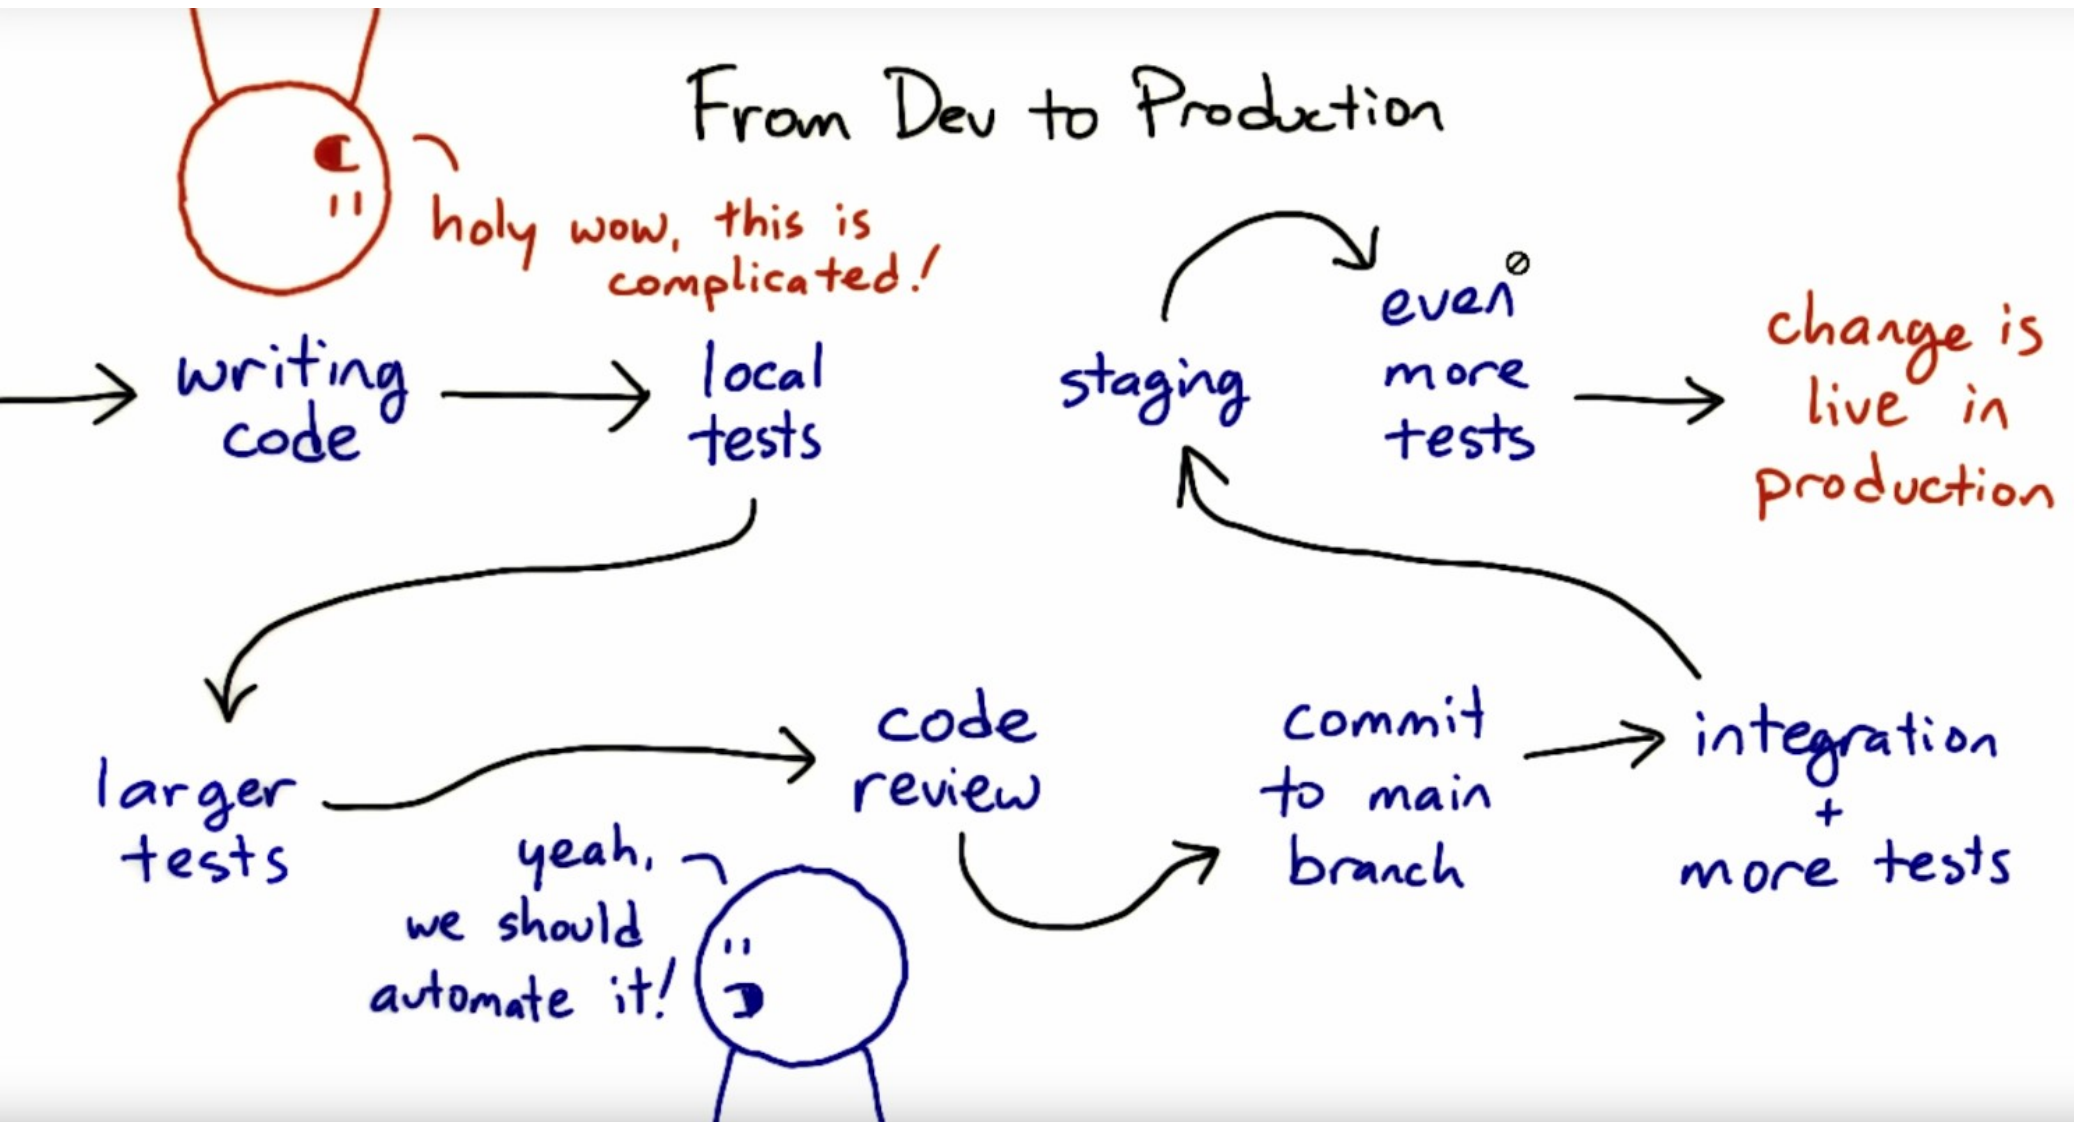

So far, so good...

Almost...

Continuous Integration

Yay! I finished writing my change!

Continuous Integration

Yay! I finished writing my change!

Now I should compile the world and
run all the tests...

Continuous Integration

Yay! I finished writing my change!

Now I should compile the world and
run all the tests...

That sounds boring...

Continuous Integration

Yay! I finished writing my change!

Now I should compile the world and
run all the tests...

That sounds boring...

I want a program to build my
program for me!

Continuous Integration

Jenkins

Continuous Integration

Jenkins

Travis CI

Circle CI

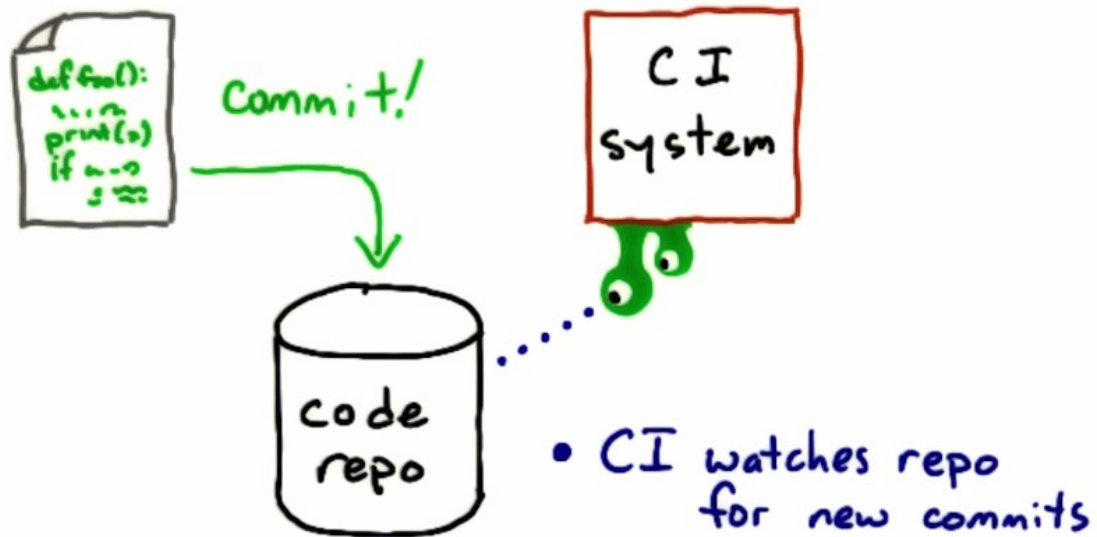

Continuous Integration

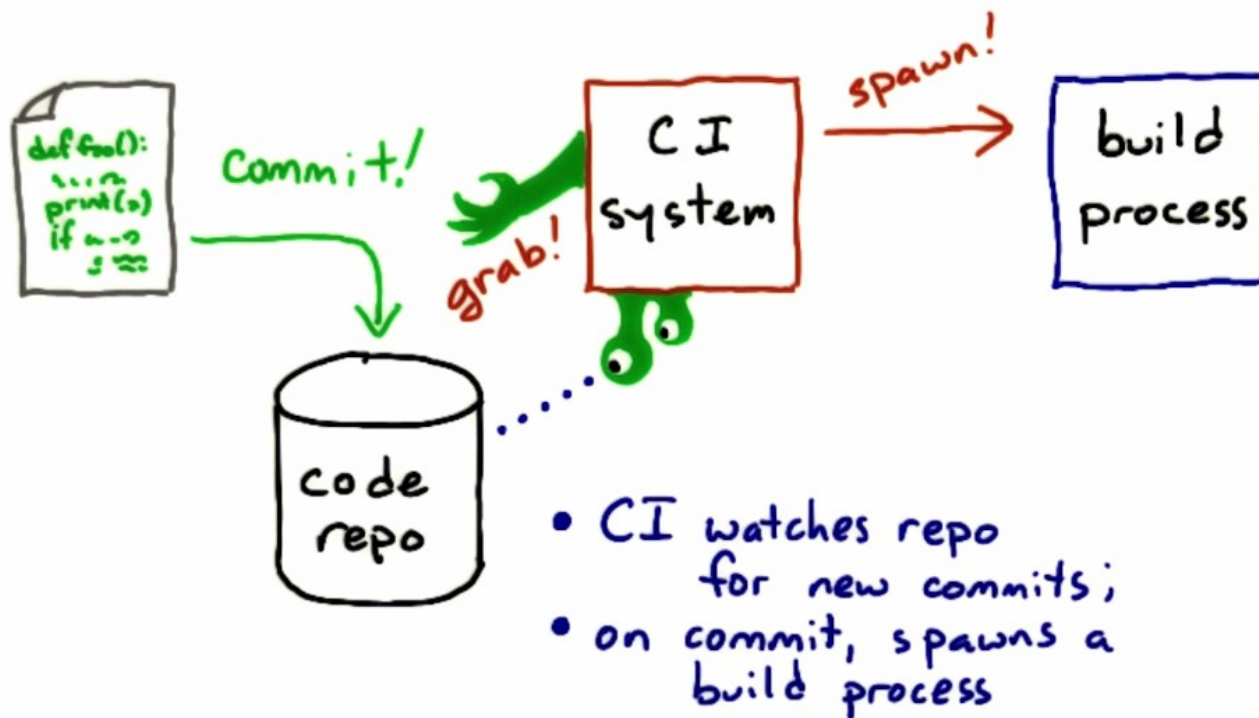

Continuous Integration

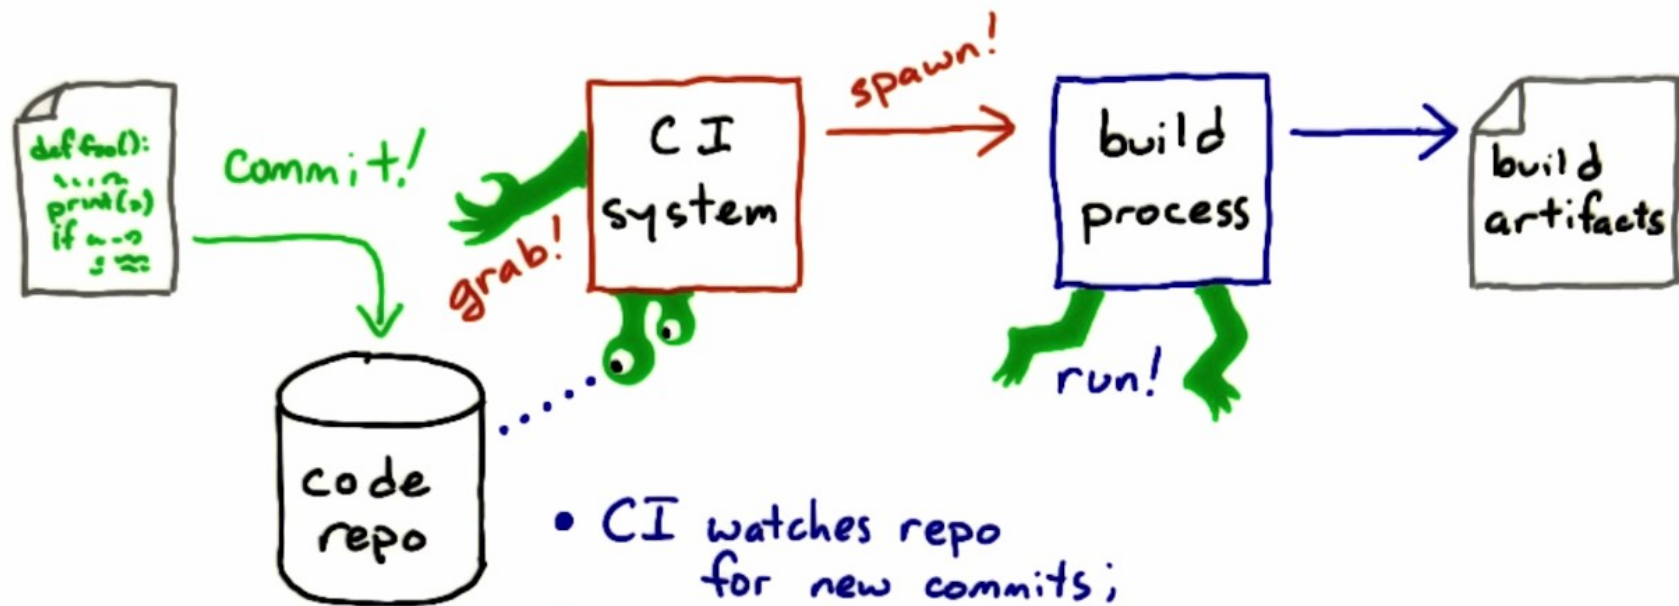

Continuous Integration

Continuous Integration

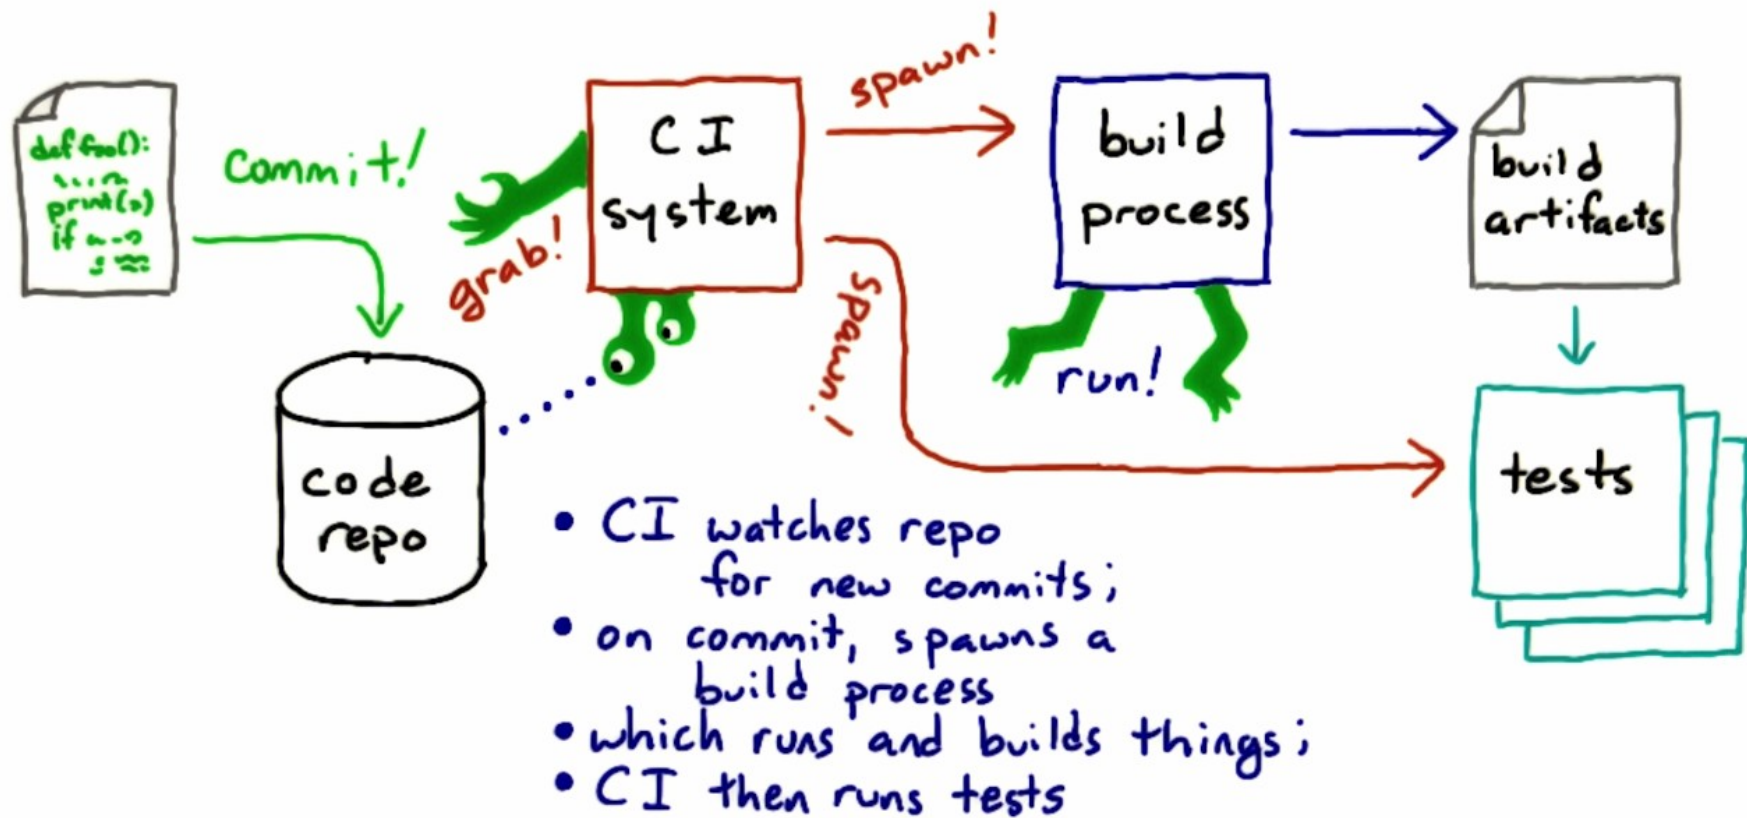

Continuous Integration

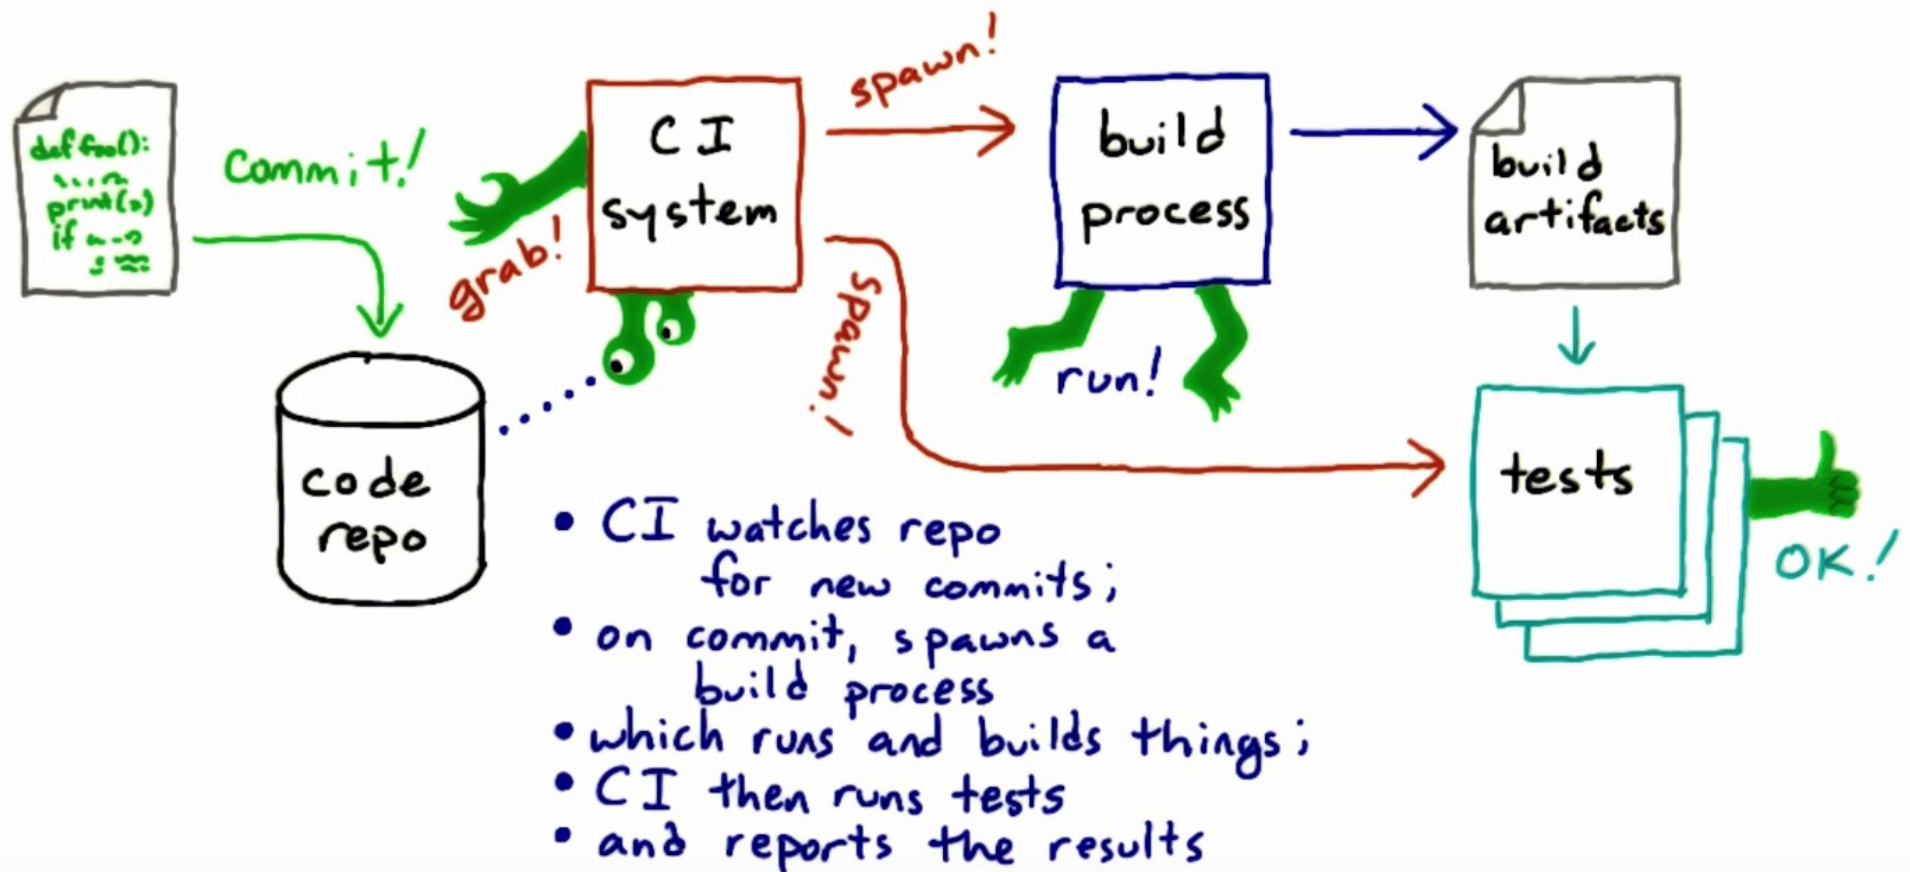

- CI watches repo for new commits;
- on commit, spawns a build process
- which runs and builds things

Testing

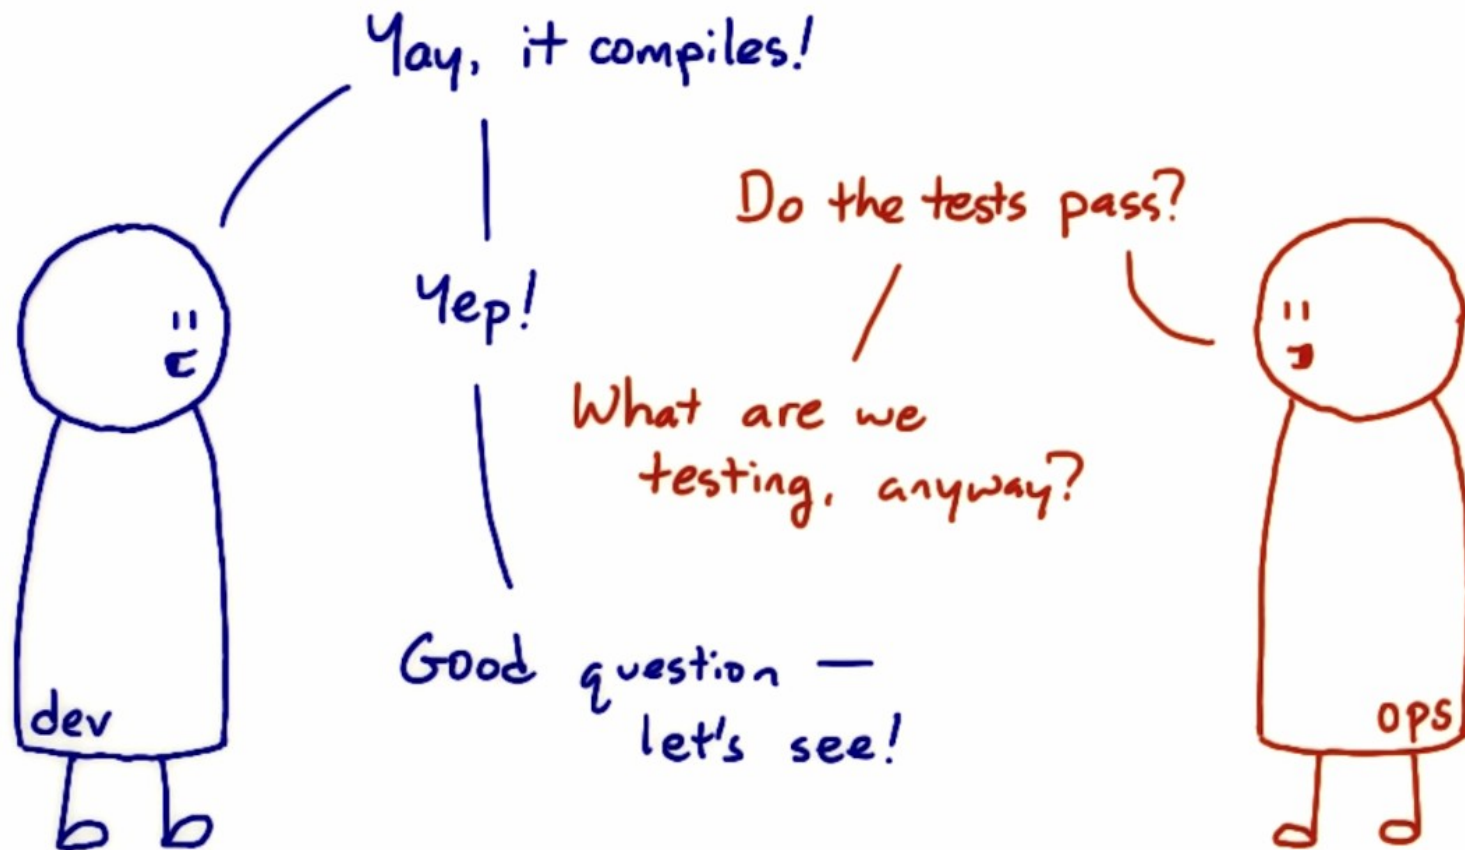

Yay, it compiles!

Do the tests pass?

Testing

Testing

Unit testing

tests written alongside code, to test the behavior of individual units such as functions or classes.

Unit tests tell me that my code does what I mean!

Testing

Unit testing

Regression testing

tests written as part of debugging, which verify that a bug is fixed. Kept in the test suite to ensure the bug is not reintroduced.

Regression tests
keep me from
making the same
bug twice!

Unit testing
Regression testing
Smoke testing

Preliminary test of a system just after build, to make sure it runs at all — for instance doesn't crash on boot.

I call it a "build verification" test.

Smoke tests save us a lot of time by keeping broken builds out of the test pipeline.

Testing

Unit testing

Regression testing

Smoke testing

System integration testing

Tests of a whole system,
including dependencies such
as databases or APIs,
under a test load

Infrastructure-as-code
makes it really
easy to do system
integration tests –
the test can spin
up an instance
dynamically.

Unit testing

Regression testing

Smoke testing

System integration testing

Automated acceptance testing

Scripted tests that verify
that user-facing features
work as planned.

We can even automate
things like checking
apps or web pages
for accessibility
requirements!

Testing

- Unit testing
- Regression testing
- Smoke testing
- System integration testing
- Automated acceptance testing
- Manual QA testing
 - Approval process integrated with continuous deployment.

Before a launch goes out,
we run it on the
test instances and
I check it over.
If it looks good,
I press the
approval button.
